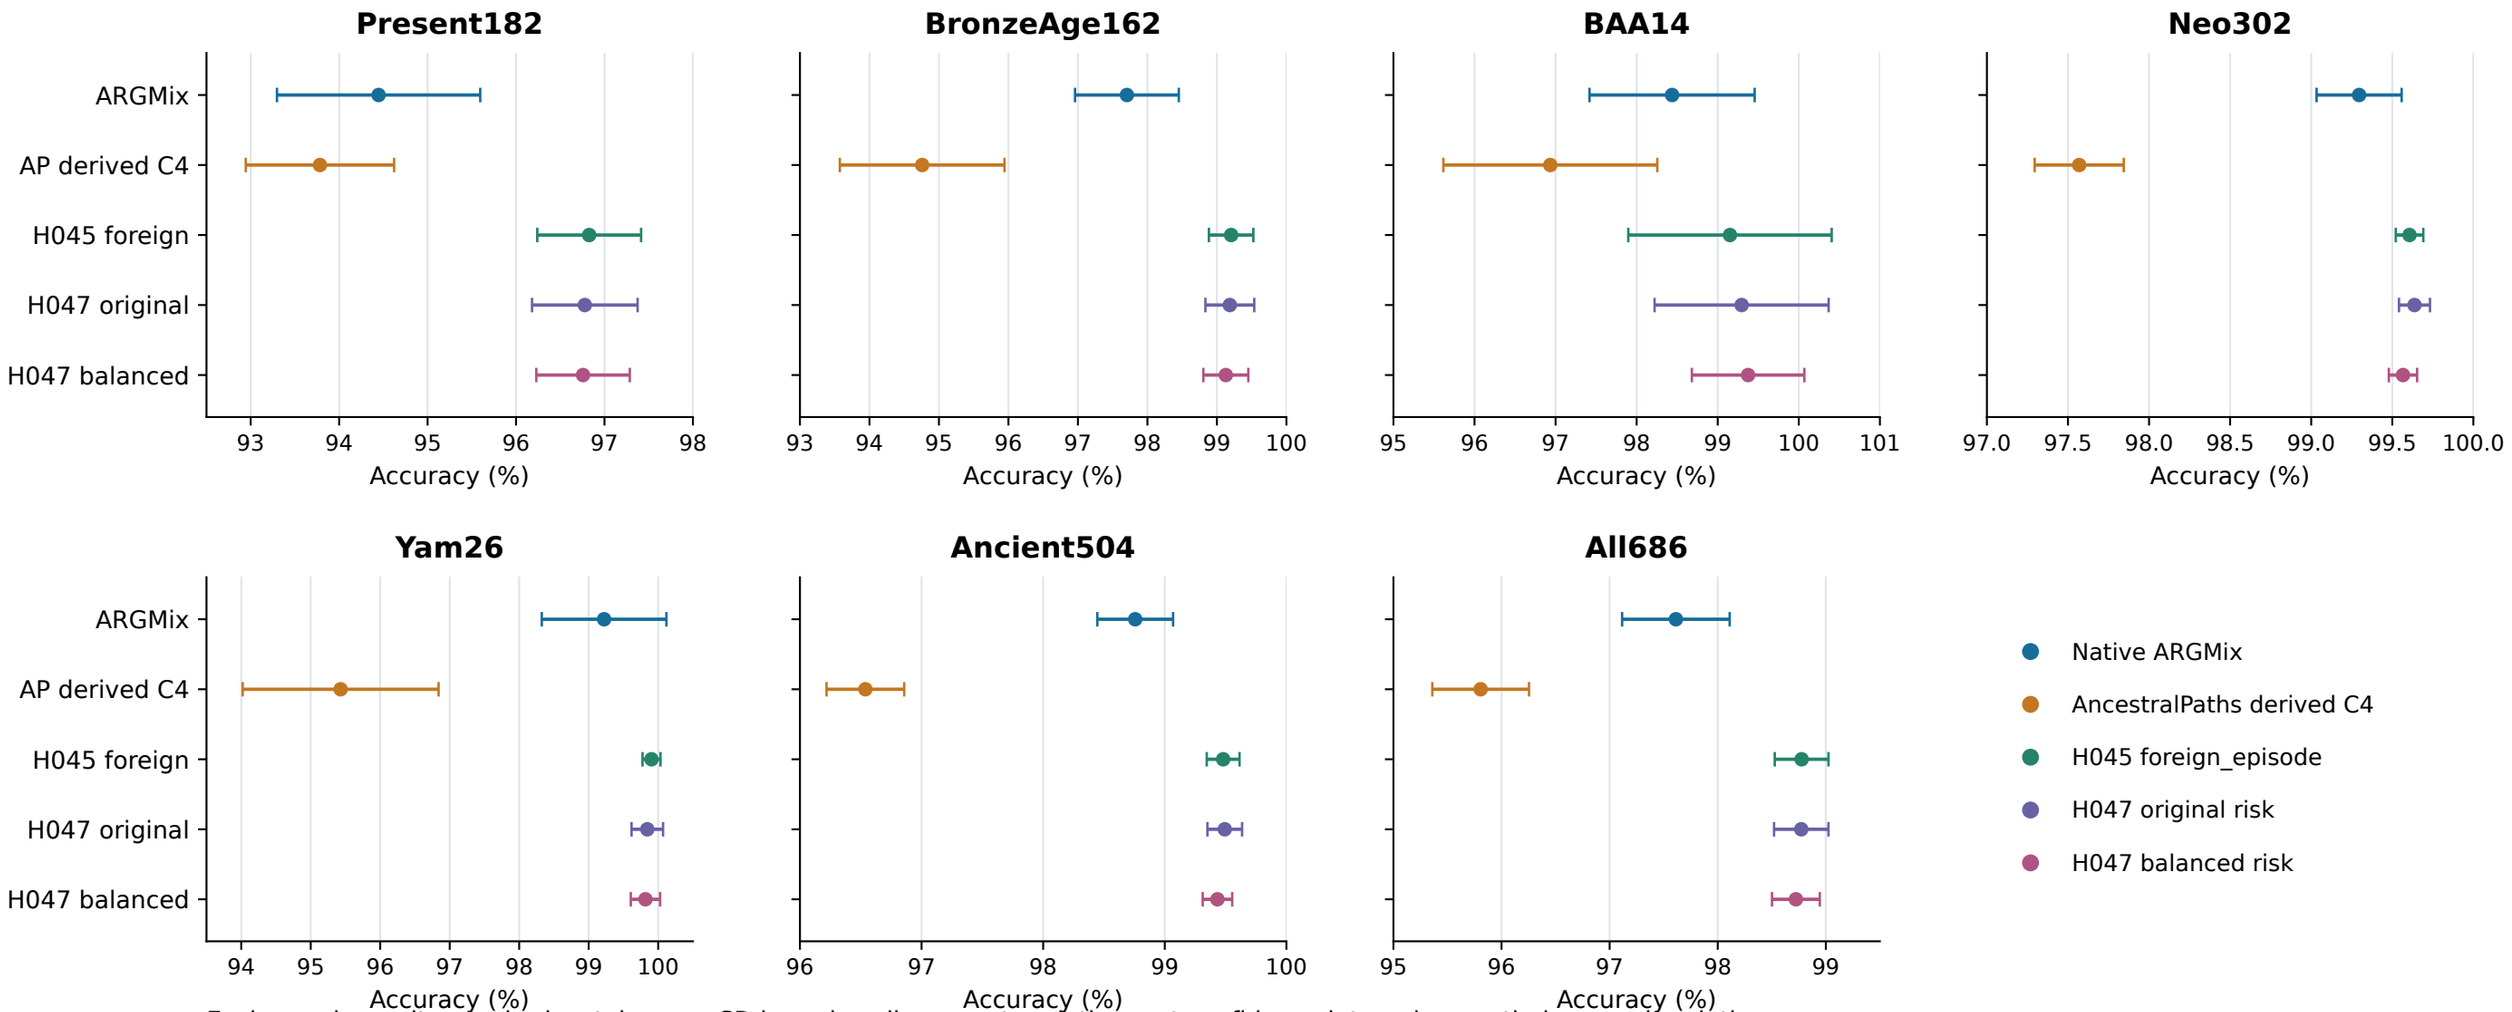
Population accuracy across the shared development panel

Equal-parent means +/- sample SD across eight VAL simulations; one completed fit per method

H047 matched original-risk and balanced-risk arms are shown separately



Each panel uses its own horizontal range. SD bars describe parent variation, not confidence intervals or optimizer-seed variation.

Present182 is primary; the other cohorts are descriptive. BronzeAge is not assumed identical to the paper's Post-Neolithic cohort.

Native objectives/budgets are retained. H045 and both H047 arms use H042 warmstarts +30 passes /960 updates per arm, seed101.
